

Bestly Stack

Agent Runbook

What the Cowork agent manages, where it lives, how to drive it, and what every future agent session should load first.

Generated	2026-05-01
Author	Cowork agent (Claude opus-4-7) operating on bestlytech repo
Owner	Jared Best — Bestly LLC, Los Angeles
Repo	github.com/Bestly-LLC/bestlytech (main branch is production)
Public	https://www.bestly.tech/ · https://bestly.tech/admin · https://bestly.tech/status
Project ID	rcqfqhguwpmarseifqg (Supabase) · prj_2YMacO2luB3clXeOHO8eeGmLELsC (Vercel)
Retired	keowunrxpxlbgebujbao (old Lovable Supabase project — see §8)

1. Mental model

The Bestly stack is a multi-product studio surface. The new agent's job is to keep **everything that lives on rcqfqhguwpmaarseifgg + the bestlytech Vercel project** healthy, observable, and shippable. The previous home — a Lovable-managed Supabase project at keowunrxpxlbgeubjbao — is being retired. Anything that still runs there is rogue and needs to be silenced or migrated.

Two-line summary of what's in scope:

(A) Public-facing surfaces: bestly.tech (marketing site), bestly.tech/admin (operator dashboard), bestly.tech/status (uptime), and the Cookie Yeti browser-extension backend that the extension talks to.

(B) Operator-facing systems: ntfy push alerting, email queue, AI pattern generator, external uptime probing, dispatch monitoring, scheduled cleanups.

2. Surfaces I manage

Public web

bestly.tech	Marketing site. Vite/React/Tailwind/shadcn. v7/v8 indigo + Newsreader theme.
bestly.tech/admin	Operator command center. Auth: Apple SSO + WebAuthn passkey. AdminLayout in src/components/admin/.
bestly.tech/status	Public uptime page reading external_health_history via get_public_status RPC. CNAME for status.bestly.tech is staged in Cloudflare → cname.vercel-dns.com (proxied).
cloud.bestly.tech	Nextcloud + Proxmox surface. Probed by external probe. Not directly managed by this agent — runbook only.

Backend (Supabase rcqfqhguwpmaarseifgg)

Postgres + Edge Functions + pg_cron. Service role key lives in scripts/.env.pi and is also configured as Deno.env on each function. RLS enabled on all admin-readable tables.

3. Edge function catalog (28 functions)

Every function in the new project's Edge Functions surface, current as of 2026-04-30. Status: **active** means it is wired to a cron or external caller; **passive** means it only fires on user request; **kill-switch** means it is a 200-stub that does nothing.

Function	Status	Purpose
ai-generate-pattern	active	Cookie Yeti pattern generator. v12. Cron every 6h at :30. Diagnostic logging enhanced 2026-04-30 (logs HTTP code/timeout reason on fetch fails).
auth-email-hook	passive	Custom auth email rendering.
auto-retry-failed-patterns	active	Cron at 06:00 and 18:00 UTC. Retries patterns that previously failed AI generation. Sends email (NOT SMS) on permanent failure.
bootstrap-vault	passive	One-shot Vault bootstrap. Apr 16 deploy.
check-system-health	active	v18. Cron every 15min. Heartbeat-based monitoring of ai_generator + cron_jobs. Sends ntfy push to topic bestly-sysalert-7q2k9mx4 with priority 5 (bypasses iOS DND). Issue-only, hysteresis 2-check, quiet hours 23-07 PT.
create-checkout	passive	Stripe checkout session for Cookie Yeti subscription.
handle-email-suppression	passive	PrivateEmail suppression callback.
handle-email-unsubscribe	passive	Unsubscribe link target.
notify-sms	kill-switch	RETIRED 2026-04-28. Twilio path retired in favor of ntfy.sh push. Returns disabled stub.
preview-transactional-email	passive	Admin preview of email templates.
probe-external	active	v4. Cron every 5min. Probes 5 external services (cookieyeti.com, hoascope.com, app.hoascope.com, cloud.bestly.tech, bestly.tech). Writes external_health + via trigger external_health_history. Sends ntfy push priority 5 when a service flips ok/warn -> down (after 2-fail hysteresis).
probe-report	passive	Cookie Yeti extension health beacon.
process-dismissal-consensus	passive	Consensus aggregation for crowd dismissals.
process-email-queue	active	v8. Cron every 2min. Drains email_queue table via PrivateEmail SMTP. Currently 401-ing on cron (auth header issue worth investigating).

Function	Status	Purpose
report-dismissal	passive	Extension reports a dismissal.
report-missed-banner	passive	Extension reports a missed cookie banner. Accepts banner_html for AI processing.
report-site	passive	Generic site report endpoint.
reset-failed-patterns	passive	Manual reset of permanently-failed pattern queue.
send-activation-code	passive	Email a 6-digit code for new Cookie Yeti subs.
send-transactional-email	passive	Direct send (bypasses queue) — used by hot paths.
stripe-webhook	passive	Stripe events → subscription state changes.
submit-contact	passive	/contact form handler.
submit-hire-request	passive	/hire form handler.
test-sms	passive	v6. Slug retained for URL compat. Sends one ntfy test push. Header: x-test-token: bestly-ntfy-test-2026-05-01-c47bbed1. Returns {ok, ntfy_status, authenticated, body, ntfy_response} so operator can verify push pipeline + whether NTFY_TOKEN is wired.
upsert-device-token	passive	Push notification token registration.
validate-activation-code	passive	Activation code validation.
validate-intake	passive	Marketplace seller intake form validator.
webauthn-authenticate	passive	Passkey login.
webauthn-register	passive	Passkey registration.

4. Cron jobs (pg_cron)

Every cron currently scheduled on rcqfqhguwpmaarseifqg. To list live: `SELECT * FROM cron.job;`

Function	Status	Purpose
ai-generate-patterns		Generate AI cookie patterns from missed_banner_reports.
auto-retry-failed-patterns		Retry failed patterns twice daily.
check-system-health		Heartbeat monitor + SMS alerting (currently silent — no Twilio creds).
cleanup-activation-codes		Drop expired Cookie Yeti activation codes.
cleanup-pihole-stats		Drop pihole stats older than 25h.
cleanup-webauthn-challenges		Expire old WebAuthn challenges.
pattern-maintenance		Run auto_fix_pattern_issues + heartbeat into pattern_fix_log.
probe-external		External uptime probe — populates external_health.
process-email-queue		Drain email queue (401-ing intermittently — investigate).
reset-failed-domains		Sunday weekly reset of permanently-failed domain queue.

(Schedule column is omitted from the table for layout; reference list above.)

5. Database — tables I touch

Not exhaustive — focused on tables this agent has actively built logic against. Run `SELECT table_name FROM information_schema.tables WHERE table_schema='public'` for the full list.

system_alert_state	Single-row table (id=1) holding current alert state. Columns: is_down, down_systems[], pending_systems[], pending_match_count, last_alerted_systems[], last_checked, last_alert_at, last_alert_sent. Currently never has last_alert_sent populated (no Twilio creds).
---------------------------	---

external_health	5 rows, one per probed service. Columns: service (PK), url, status (ok/warn/down/unknown), http_code, latency_ms, error_message, last_checked, last_ok, consecutive_failures.
external_health_history	Append-only, written by AFTER trigger on external_health writes. Source for /status sparklines. RLS: admins read only.
ai_generation_log	Audit trail for every AI pattern generation attempt. status enum: success, no_candidates, skipped_no_html, permanently_failed, error. error_message column now contains structured failure reasons (e.g. 'HTTP 403', 'Timeout 10s').
pattern_fix_log	Heartbeat target for pattern-maintenance cron. Read by check-system-health to determine if cron is healthy.
missed_banner_reports	Cookie Yeti extension's 'this site has a banner my pattern doesn't catch' submissions. Drives ai-generate-pattern.
cookie_patterns	Active pattern catalog. is_active=true patterns are pushed to extensions.
home_hub_pihole_stats	Pi-hole stats pushed every ~30s by Pi-side script (scripts/push_pihole_stats.py). Auto-pruned to 25h via DB trigger.
pg_cron.job	(in extensions schema) — scheduling source of truth.

6. Credentials + secrets

Alerting (current — ntfy.sh push):

- NTFY_TOPIC (optional) — defaults to bestly-sysalert-7q2k9mx4 in code if unset. Treat the topic name like a credential: anyone who knows it can post to it AND receive notifications.
- NTFY_TOKEN (optional) — if set, attaches Authorization: Bearer header to ntfy POSTs, lifting the free-tier 250-messages-per-day-per-IP cap. Without it, alerting works on best-effort up to 250/day on the shared Supabase Edge IP. Acquire by signing in at ntfy.sh and generating a token (starts with tk_).

Twilio (retired):

LOVABLE_API_KEY and TWILIO_API_KEY are not configured on this project. The previous SMS-via-Lovable-connector path is no longer used. Old project keowunrxp1bgebujbao retains them; we did not migrate. Re-enabling Twilio is not on the roadmap.

Already configured (verified):

- SUPABASE_URL, SUPABASE_SERVICE_ROLE_KEY, SUPABASE_ANON_KEY
- OPENAI_API_KEY — for ai-generate-pattern
- STRIPE_SECRET_KEY, STRIPE_WEBHOOK_SECRET — for subscriptions
- PRIVATEMAIL_EMAIL, PRIVATEMAIL_PASSWORD — for SMTP
- MAINTENANCE_SECRET — admin-callable cron headers

7. MCP tools a future agent needs

These MCP servers must be connected for the agent to operate the stack. If any are missing the agent should call `request_access` (computer-use) or ask the user to install the connector.

Supabase MCP	Required. <code>project_id rcqfqhguwpmaarseifgg</code> . Provides <code>apply_migration</code> , <code>deploy_edge_function</code> , <code>execute_sql</code> , <code>get_logs</code> , <code>get_edge_function</code> , <code>list_edge_functions</code> .
Vercel MCP	Required. <code>team_Kwxz5PIgolwApAnbC131PCDd</code> . Project <code>prj_2YMacO2luB3clXeOHO8eeGmLELsC</code> . Provides deployment ops + log reading.
Claude in Chrome	Required for Cloudflare DNS + Vercel domain ops. The user is logged into both.
Computer-use (desktop)	Required for Finder file ops, opening <code>publish-*.command</code> scripts, and Terminal verification.
MemPalace MCP	Optional but high-value. <code>wing_bestly</code> already has 2 drawers. New agents should call <code>mempalace_status</code> and <code>mempalace_search('bestly cookie yeti supabase')</code> first thing.
Plugins MCP	Required to invoke skills (pdf, docx, xlsx, pptx, schedule).

8. Lovable retirement status

Old Lovable project keowunrxpxlbgubjbao was the source of all rogue Cookie Yeti SMS through 2026-05-01. Operator ran the handoff prompt on that project the same day. Verified outcome:

- All 7 active pg_cron jobs there were unscheduled. `SELECT * FROM cron.job` on the old project returns empty.
- 16 edge functions neutralized to 200-stubs returning `{status: 'retired', forwarded_to: 'rcqfqhguwpmaarseifqg'}`. Slugs kept alive for URL compat.
- Twilio + PrivateMail secrets remain set on the old project (untouched), but no code there uses them anymore. The new project does NOT need them — alerting moved to ntfy.sh.
- Stripe webhook intentionally left wired on the old project so historical billing events still record into `webhook_events`. No notifications fire from there.
- A retirement banner was added to the old project's README and a RETIRED.md was created at its repo root.

Verified silent for 30+ minutes after handoff — no new SMS received. Issue closed.

9. Recent change history

The last 7 days of operator-visible changes, newest first:

2026-04-30	P3 — public /status page deployed. <code>external_health_history</code> + <code>get_public_status</code> RPC. CNAME <code>status.bestly.tech</code> added on Cloudflare (Vercel domain bind pending operator login).
2026-04-30	P2 — admin pages reskinned in v7/v8 indigo + Newsreader. <code>PageHeader</code> uses <code>font-display</code> , <code>AdminSidebar</code> active row gets indigo glow.
2026-04-30	P1.1 — ai-generate-pattern fetcher returns <code>{html, reason}</code> so failure modes (HTTP 403, Timeout 10s, DNS, no-CMP) land in <code>ai_generation_log.error_message</code> . Added <code>Sec-Ch-Ua</code> + <code>Sec-Fetch-*</code> headers.
2026-04-30	P1 cleanup — 5 stale <code>.claude/worktrees/</code> + 5 <code>dist-v*</code> dirs + <code>feature/admin-ui-overhaul</code> branch retired. ~90MB reclaimed. <code>.gitignore</code> tightened.
2026-04-30	P0 — <code>SystemPulse</code> rewritten (was reading 4 columns that didn't exist), <code>ActionInbox</code> email column-name bugs fixed, <code>AdminDashboard</code> <code>userCount</code> double-count removed, <code>SmartAlerts</code> 0% AI escalates to CRITICAL.
2026-04-30	<code>probe-external</code> + <code>external_health</code> table + 5min cron deployed. <code>check-system-health</code> bumped to v13 (<code>status='success'</code> filter on AI heartbeat, threshold 12h→72h).
2026-04-29	v8 — bottom Bestly wordmark on homepage. <code>cursor-X</code> parallax.

2026-04-29	v7 — site-wide indigo retarget. NoiseField, Scanlines, Orbits backgrounds wired to /products, /services, /contact.
2026-04-26	notify-sms emergency kill-switch deployed (returns disabled stub) — initial response to rogue-sender investigation.

10. New session checklist

When a future agent session opens for the first time, run through this list before taking any action:

1. **Read this PDF.** docs/agent-runbook.pdf in the bestlytech repo.
2. **Load MemPalace.** Call mempalace_status, then mempalace_search('bestly') to surface the wing_bestly drawers.
3. **Verify auth.** Confirm Supabase MCP connected (list_projects → rcqfqhguwpmaarseifqg). Confirm Vercel MCP connected (list_teams → team_Kwxz5PIgolwApAnbC131PCDd).
4. **Check current alert state.** SELECT * FROM system_alert_state WHERE id=1. If is_down=true, that's the first thing to address.
5. **Check external services.** SELECT * FROM external_health ORDER BY status DESC. Anything in 'down' status needs operator attention (likely DreamHost/Namecheap-side).
6. **Pull recent edge logs.** get_logs(service='edge-function') — look for repeated 401s or 5xx.
7. **Read the operator's task list.** If they've left tasks open via TaskList, drive those first.
8. **Pending decisions to be aware of:** migrate cookieyeti.com off DreamHost (recommended); build app.hoascope.com (no deployment exists yet); add Twilio creds to new project (still missing).

11. Out of scope (do not touch)

These are systems the agent should be aware of but should NOT modify without explicit operator instruction:

Pi-hole pusher	scripts/push_pihole_stats.py runs on a Raspberry Pi the agent does not have SSH access to. Read-only on this side.
DreamHost vhosts	cookieyeti.com is hosted there. Operator manages cert/vhost via panel.dreamhost.com directly.
Namecheap DNS	hoascope.com NS lives there. Currently a parking page.
Apple Developer / ASC	Cookie Yeti / future iOS apps. Operator handles in App Store Connect.
Stripe live mode	Subscriptions go through Stripe — DO NOT trigger refunds, cancellations, or test-mode toggles. Read-only via Stripe MCP if connected.
Confesh project	Separate Lovable project + repo. Has its own MemPalace wing.
Other Bestly products	InventoryProof, ParentIQ, SchoolPilot, NeckPilot, Hoku, etc. — separate codebases.

End of runbook. If anything in this document is wrong or stale, fix it in source (outputs/build_runbook.py in the agent's session sandbox) and regenerate. Last regeneration: 2026-05-01.
